

CONVEYING - SLOVENIA

## LONG, HIGH CONVEYING NEEDS MET WITH AIR-CUSHION EXPERTISE

Slovenia's largest cement producer, Saloniit Anhovo, was looking for a way to decrease its reliance on fossil fuels and embark on a project that would see the plant switch to a sustainable, alternative fuel source, requiring high-capacity conveying over long distances.

### Customer need

Based in Deskle, near the village of Anhovo, about 20km north of Nova Gorica, is Slovenia's largest producer of cement, Saloniit Anhovo. As part of its commitment to environmental sustainability, Saloniit Anhovo has embarked on an ambitious path for its Anhovo cement plant, citing an intention to reduce its reliance on fossil fuels and to be carbon-neutral by 2035.

Saloniit Anhovo investigated many power-generation options, ultimately opting for a good alternative to oil and coal, domestic refuse and shredded tires.

Once it decided on an alternative fuel, the company needed to secure its reliable, high-capacity supply. For this, it required an out-of-the-ordinary approach to dry bulk material conveying, needing to transfer material over a distance of more than 480m, with an inclination of seven degrees, and an unloading point located 50m above ground level.

### Our solution

Bruks Siwertell worked closely with Saloniit Anhovo to find the best conveyor configuration for transferring waste material from the receiving and shredding station to the plant's preheater tower.

For long, high conveying, Bruks Siwertell has the ideal solution, the Bruks Tubulator. It is part of an innovative air-supported conveying range, which eliminates the use of idlers from under the belt and deliver low-friction, high-capacity conveying with minimal equipment wear and very low operating costs. The Tubulator achieves capacities up to 40 percent higher than comparable conventional idler belt conveyors.

At Anhovo, the Bruks Siwertell solution uses Tubulator type-CT 830 conveyors, which deliver a continuous refuse derived fuel and shredded tire handling rate of 20t/h (160 m<sup>3</sup>/h).

### FACTS

#### CATEGORIES:

- Conveying

#### MATERIALS:

- Other

#### CUSTOMER:

Saloniit Anhovo

#### ADDITIONAL FACTS:

##### Product

Tubulator conveyor  
type-CT 830

##### Material handled

Refuse derived fuel and  
shredded tires at a rate  
of 20t/h (160 m<sup>3</sup>/h)

#### PRODUCTS:

- Conveying

#### LOCATION:

Deskle, Slovenia

Tubulator conveyors are also totally enclosed, eliminating spillage and dust emissions. They have a rigid design and employ suspension cable tower technology that reduces foundation requirements and minimizes construction costs. This enables long installations over difficult terrains with minimal supports between spans. It also makes it easier to route a conveyor in an existing plant, such as Anhovo.
